

Forklift Extension Booms

Forklift Extension Boom - Normally, we think of forklifts as machines used for moving and picking up pallets. There are extensions existing to give the forklift more length and more strength for heavier loads. By utilizing one of the four major forklift booms, your forklift can be useful for different other applications. The four main forklift booms are the carpet boom, the coil boom, the pipe boom and the shooting boom. Each of these are designed for attachment onto your forklift.

Coil Poles

Able to connect to the forklift's carriage, coil poles are built to transfer rolled coils and other rolled materials like concrete poles or reels of wire. Coil poles will allow you to transport whatever cylinder or rolled material as well.

Carpet Poles

Carpet poles are a heavy duty attachment constructed from EN24T steel. They mount directly onto the forklifts' carriage. They are known as carpet poles but are even utilized to be able to transfer other types of rolled floor coverings in addition to cylinder products. They don't have the capability to pick up heavy stuff like for instance coil poles or concrete pipes.

Shooting Forklift Booms or Telehandlers

Shooting forklift booms are also known as telehandlers or telescopic booms. They are extremely handy on rough terrain forklifts and raise to heights of twenty to forty feet. These booms are normally utilized outside on construction jobsites or within the agricultural industry.

Booms Must Not Be Used On Pipes

Extreme damage can occur to the interior of a pipe when using whatever kind of boom to be able to transfer the pipe. It is suggested that a hauling sling be used in place of a pipe boom in this specific application. Every now and then, cylinder shaped pipes and steel pipes should be moved using a boom whenever a lifting sling is unavailable. In these instances, care must be taken to make certain the pipes interior integrity.

Additional Types

Two added booms could be used together with your forklift; the clear view boom and the low profile boom. None of these booms attaches to the carriage but in its place attaches to the forklifts' forks. They allow an easy transition from pallet to rolled or coiled things together with the extra benefit of offering a clear line of sight for the operator.

Training for Safety

People operating the lift trucks should complete training so as to operate the machine in the most safe and practical manner. Preparation is designed to keep the person operating it safe and to avoid injury to people who are working in the same area. Lift trucks are a heavy piece of industrial equipment and considered to be a potentially dangerous machine. People who work with and around them have to comply with and comprehend all of the safety measures.

Additional training should be provided to those who will be dealing with lift truck booms. This would make certain they comprehend how to carefully operate the booms. Accidents have happened on the job from failure to safely work a boom. Some makers offer training courses on the different types of booms and a few offer on-site education where employees could be trained directly where they would be working. This on-hand training allows the trainer a chance to deal with all safety concerns at that specific job location.
